Title: ENVY-SENSOR

Abstrak:  (Jun 29, 02:41 GMT)

Author keywords: IoT

sistem fertigasi

Topics: Penyelidikan dalam Pengajaran dan Pembelajaran

Abstract: Proses penyiraman dan pembajaan adalah antara aspek yang penting dalam penjagaan tanaman hiasan. Kedua-dua proses ini biasanya memerlukan komitmen tenaga dan masa yang banyak dari pengguna. Kaedah fertigasi yang membekalkan air dan baja secara serentak dapat membantu menyelesaikan masalah ini. Faktor seperti suhu persekitaran, pH dan kelembapan tanah adalah komponen penting yang perlu dikawal dalam menentukan keperluan penyiraman dan pembajaan diadakan pada waktu yang optimum. Namun yang demikian, waktu penyiraman dilakukan adalah mengikut anggaran pengguna dan bukanlah mengikut keperluan sebenar tanaman. Oleh itu, penyiraman dan pembajaan yang biasa dilakukan adalah tidak begitu efektif dan berkesan. Satu kaedah yang dapat menentukan tahap sebenar tanah dan tanaman perlu dihasilkan bagi memastikan proses penyiraman dan pembajaan hanya dilakukan pada waktu yang optimum bagi tanaman. Oleh itu, Envi-sensor adalah alat yang boleh mengesan kadar kelembapan tanah pada waktu sebenar dengan mengimplementasi teknologi Internet of Things dengan menggunakan sistem Arduino. Dengan menggunakan Envi-sensor, keadaan tanah dapat dipastikan berada dalam keadaan yang sesuai dan terbaik untuk melakukan proses penyiraman dan pembajaan. Envi-sensor diharap dapat mengatasi masalah yang selama ini dihadapi oleh pengguna yang biasanya menggunakan mata kasar untuk mengetahui keadaan tanah tanaman dalam keadaan lembab atau tidak.
